Abstract:
Mean sum square prime labeling of a graph is the labeling of the vertices with {0,1,2,...,p-1} and the edges with mean of the square of the sum of the labels of the incident vertices or mean of the square of the sum of the labels of the incident vertices and one, depending on the sum is even or odd. The greatest common incidence number of a vertex (gcin) of degree greater than one is defined as the greatest common divisor of the labels of the incident edges. If the gcin of each vertex of degree greater than one is one, then the graph admits mean sum square prime labeling. Here we identify some cycle related graphs for mean sum square prime labeling.

Keywords: Graph Labeling; Sum Square; Greatest Common Incidence Number; Prime Labeling; Cycles.

1. Introduction

All graphs in this paper are simple, finite and undirected. The symbol V(G) and E(G) denotes the vertex set and edge set of a graph G. The graph whose cardinality of the vertex set is called the order of G, denoted by p and the cardinality of the edge set is called the size of the graph G, denoted by q. A graph with p vertices and q edges is called a (p,q)- graph.

A graph labeling is an assignment of integers to the vertices or edges. Some basic notations and definitions are taken from [2],[3] and [4]. Some basic concepts are taken from [1] and [2]. In [5], we introduced the concept of sum square prime labeling and proved the result for some cycle related graphs. In [6], [7], [8], [9], we proved the result for some path related graphs, some snake related graphs, some tree graphs, triangular belt, jelly fish graph, some star related graphs. In this paper we introduced mean sum square prime labeling using the concept greatest common incidence number of a vertex. We proved that some cycle related graphs admit mean sum square prime labeling.
Definition: 1.1 Let $G$ be a graph with $p$ vertices and $q$ edges. The greatest common incidence number ($gc_{in}$) of a vertex of degree greater than or equal to 2, is the greatest common divisor ($gcd$) of the labels of the incident edges.

2. Main Results

Definition 2.1 Let $G = (V, E)$ be a graph with $p$ vertices and $q$ edges. Define a bijection $f : V(G) \rightarrow \{0, 1, 2, 3, \ldots, p-1\}$ by $f(v_i) = i-1$, $1 \leq i \leq p$ and define a 1-1 mapping $f_{mssp}^* : E(G) \rightarrow$ set of natural numbers $N$ by

$f_{mssp}^*(uv) = \frac{(f(u)+f(v))^2}{2}$, when $f(u)+f(v)$ is even.

$f_{mssp}^*(uv) = \frac{(f(u)+f(v))^2 + 1}{2}$, when $f(u)+f(v)$ is odd. The induced function $f_{mssp}^*$ is said to be a mean sum square prime labeling, if the $gc_{in}$ of each vertex of degree at least 2, is 1.

Definition 2.2 A graph which admits mean sum square prime labeling is called a mean sum square prime graph.

Theorem 2.1 Cycle $C_n$ admits mean sum square prime labeling, if $n$ is odd.

Proof: Let $G = C_n$ and let $v_1, v_2, \ldots, v_n$ are the vertices of $G$

Here $|V(G)| = n$ and $|E(G)| = n$

Define a function $f : V \rightarrow \{0, 1, 2, 3, \ldots, n-1\}$ by

$f(v_i) = i-1$, $i = 1, 2, \ldots, n$

Clearly $f$ is a bijection.

For the vertex labeling $f$, the induced edge labeling $f_{mssp}^*$ is defined as follows

$f_{mssp}^*(v_i v_{i+1}) = 2i^2 - 2i + 1$, $i = 1, 2, \ldots, n-1$

$f_{mssp}^*(v_1 v_n) = \frac{(n-1)^2}{2}$

Clearly $f_{mssp}^*$ is an injection.

$gc_{in}$ of $(v_1)$ = gcd of \{ $f_{mssp}^*(v_1 v_2)$, $f_{mssp}^*(v_1 v_n)$ \}

= gcd of \{ 1, $\frac{(n-1)^2}{2}$\} = 1.

$gc_{in}$ of $(v_{i+1})$ = gcd of \{ $f_{mssp}^*(v_i v_{i+1})$, $f_{mssp}^*(v_{i+1} v_{i+2})$ \}

= gcd of \{ 2i^2-2i+1, 2i^2+2i+1 \}

= gcd of \{ 4i, 2i^2-2i+1 \},

= gcd of \{ i, 2i^2-2i+1 \} = 1, $i = 1, 2, \ldots, n-2$

$gc_{in}$ of $(v_n)$ = gcd of \{ $f_{mssp}^*(v_{n-1} v_n)$, $f_{mssp}^*(v_1 v_n)$ \},

= gcd of \{ $2n^2-6n+5$, $\frac{(n-1)^2}{2}$\}, put $n = 2k-1$

= gcd of \{ $8k^2-20k+13$, $2(k-1)^2$\}

= gcd of \{ $(k-1)$, $(k-1)(8k-12)+1 \} = 1.$

So, $gc_{in}$ of each vertex of degree greater than one is 1.

Hence $C_n$ admits mean sum square prime labeling.

Definition 2.3 The tadpole graph is the graph obtained by joining a cycle $C_n$ to a path $P_m$ and is denoted by $C_n(P_m)$.
Theorem 2.2 Tadpole graph \( C_n(P_m) \) admits mean square prime labeling, if \( n \) is odd.
Proof: Let \( G = C_n(P_m) \) and let \( v_1,v_2,\ldots,v_{n+2m} \) are the vertices of \( G \)
Here \( |V(G)| = n+2m \) and \( |E(G)| = n+2m-2 \)
Define a function \( f : V \rightarrow \{0,1,2,3,\ldots,n+2m-2\} \) by 
\[
f(v_i) = i-1 \quad i = 1,2,\ldots,n+2m-2
\]
Clearly \( f \) is a bijection.
For the vertex labeling \( f \), the induced edge labeling \( f_{mssp}^* \) is defined as follows 
\[
f_{mssp}^*(v_i v_{i+1}) = 2i^2 - 2i + 1, \quad i = 1,2,\ldots,n+2m-2
\]
\[
f_{mssp}^*(v_1 v_n) = \frac{(n-1)^2}{2}
\]
Clearly \( f_{mssp}^* \) is an injection.
\[
gcin \ \text{of} \ (v_i) = \gcd \{ f_{mssp}^*(v_1 v_2), f_{mssp}^*(v_1 v_n) \} = 1.
\]
\[
gcin \ \text{of} \ (v_{i+1}) = \gcd \{ f_{mssp}^*(v_i v_{i+1}), f_{mssp}^*(v_{i+1} v_{i+2}) \}
\]
\[
= 1, \quad i = 1,2,\ldots,n+2m-3
\]
So, \( gcin \) of each vertex of degree greater than one is 1.
Hence \( C_n(P_m) \), admits mean sum square prime labeling.

Definition 2.4 Let \( G \) be the graph obtained by joining two copies of path \( P_m \) to two consecutive vertices of cycle \( C_n \). \( G \) is denoted by \( C_n(2P_m) \).

Theorem 2.3 The graph \( C_n(2P_m) \) admits mean square prime labeling, if \( m \) and \( n \) are odd.
Proof: Let \( G = C_n(2P_m) \) and let \( v_1,v_2,\ldots,v_{n+2m-2} \) are the vertices of \( G \)
Here \( |V(G)| = n+2m-2 \) and \( |E(G)| = n+2m-2 \)
Define a function \( f : V \rightarrow \{0,1,2,3,\ldots,n+2m-3\} \) by 
\[
f(v_i) = i-1 \quad i = 1,2,\ldots,n+2m-2
\]
Clearly \( f \) is a bijection.
For the vertex labeling \( f \), the induced edge labeling \( f_{mssp}^* \) is defined as follows 
\[
f_{mssp}^*(v_i v_{i+1}) = 2i^2 - 2i + 1, \quad i = 1,2,\ldots,n+2m-3
\]
\[
f_{mssp}^*(v_m v_{m+n-1}) = \frac{(2m+n-3)^2}{2}
\]
Clearly \( f_{mssp}^* \) is an injection.
\[
gcin \ \text{of} \ (v_{i+1}) = \gcd \{ f_{mssp}^*(v_i v_{i+1}), f_{mssp}^*(v_{i+1} v_{i+2}) \}
\]
\[
= 1, \quad i = 1,2,\ldots,n+2m-4
\]
So, \( gcin \) of each vertex of degree greater than one is 1.
Hence \( C_n(2P_m) \), admits mean sum square prime labeling.

Definition 2.5 Duplication of a vertex \( v \) of graph \( G \) produces a new graph \( H \) by adding a vertex \( u \) such that \( N(v) = N(u) \). \( N(x) \) represents neighborhood of the vertex \( x \).

Theorem 2.4 Let \( G \) be the graph obtained by duplicating a vertex in Cycle \( C_n \). \( G \) admits mean sum square prime labeling, if \( n \) is odd and \( (n+1) \neq 0 \mod 10 \).
Proof: Let \( G \) be the graph and let \( v_1,v_2,\ldots,v_{n+1} \) are the vertices of \( G \)
Here \( |V(G)| = n+1 \) and \( |E(G)| = n+2 \)
Define a function \( f : V \rightarrow \{0,1,2,3,\ldots,n\} \) by 
\[
f(v_i) = i-1 \quad i = 1,2,\ldots,n+1
\]
Clearly \( f \) is a bijection.

For the vertex labeling \( f \), the induced edge labeling \( f^*_{mssp} \) is defined as follows

\[
f^*_{mssp}(v_i v_{i+1}) = 2i^2 - 2i + 1, \quad i = 1,2,---,n
\]

\[
f^*_{mssp}(v_1 v_n) = \frac{(n-1)^2}{2}
\]

\[
f^*_{mssp}(v_2 v_{n+1}) = \frac{(n+1)^2}{2}
\]

Clearly \( f^*_{mssp} \) is an injection.

\[
gcin \text{ of } (v_1) = \gcd \{ f^*_{mssp}(v_1 v_2), f^*_{mssp}(v_1 v_n) \} = 1.
\]

\[
gcin \text{ of } (v_{i+1}) = \gcd \{ f^*_{mssp}(v_i v_{i+1}), f^*_{mssp}(v_{i+1} v_{i+2}) \} = 1, \quad i = 1,2,---,n-1
\]

\[
gcin \text{ of } (v_{n+1}) = \gcd \{ f^*_{mssp}(v_{n+1} v_n), f^*_{mssp}(v_2 v_{n+1}) \} = \gcd \{ 2n^2-2n+1, \frac{(n+1)^2}{2} \}, \text{ put } n = 2k-1
\]

\[
= \gcd \{ 8k^2-12k+5, 2k \}
\]

\[
= \gcd \{ k, 8k^2-12k+5 \}
\]

= 1, since \((n+1) \not\equiv 0 \pmod{10}\), then \( k \not\equiv 0 \pmod{5}\)

So, \( gcin \) of each vertex of degree greater than one is 1.

Hence \( G \), admits mean sum square greater than one is 1.

\[
\text{Hence } G, \text{ admits mean sum square prime labeling.} \quad \blacksquare
\]

**Example 2.1** Vertex duplication in cycle \( C_5 \)

![Figure 2.1](image)

**Definition 2.6** Duplication of an edge \( e = ab \) of a graph \( G \) produces a new graph \( H \) by adding an edge \( f = xy \) such that \( N(x) = N(a) \cup \{y\} - \{b\} \) and \( N(y) = N(b) \cup \{x\} - \{a\} \).

**Theorem 2.5** Let \( G \) be the graph obtained by duplicating an edge in Cycle \( C_n \). \( G \) admits mean sum square prime labeling, if \( n \) is odd and \( (n+3) \not\equiv 0 \pmod{26} \).

Proof: Let \( G \) be the graph and let \( v_1,v_2,---,v_{n+2} \) are the vertices of \( G \)

Here \(|V(G)| = n+2 \) and \(|E(G)| = n+3 \)

Define a function \( f : V \to \{0,1,2,3,---,n+1 \} \) by

\[
f(v_i) = i-1, \quad i = 1,2,---,n+2
\]

Clearly \( f \) is a bijection.

For the vertex labeling \( f \), the induced edge labeling \( f^*_{mssp} \) is defined as follows

\[
f^*_{mssp}(v_i v_{i+1}) = 2i^2 - 2i + 1, \quad i = 1,2,---,n+1
\]
Clearly $f_{mssp}$ is an injection.

$\text{gcd}(v_1) = \text{gcd}\{f_{mssp}(v_1, v_2), f_{mssp}(v_1, v_n)\} = 1$.

$\text{gcd}(v_{i+1}) = \text{gcd}\{f_{mssp}(v_i, v_{i+1}), f_{mssp}(v_{i+1}, v_{i+2})\} = 1, \quad i = 1, 2, \ldots, n.$

$\text{gcd}(v_{n+2}) = \text{gcd}\{f_{mssp}(v_{n+1}, v_{n+2}), f_{mssp}(v_3, v_{n+2})\}
= \text{gcd}\{2n^2+2n+1, \frac{(n+3)^2}{2}\}, \quad \text{put } n = 2k-1
= \text{gcd}\{8k^2-4k+1, 2(k+1)^2\}
= \text{gcd}\{k+1, 8k^2-4k+1\}
= \text{gcd}\{13, k+1\}
= 1. \text{ Since } (n+3) \not\equiv 0 \pmod{26}, \text{ then } (k+1) \not\equiv 0 \pmod{13}.$

So, $\text{gcd}$ of each vertex of degree greater than one is 1.

Hence $G$, admits mean sum square greater than one is 1.

**Example 2.2** Duplication of an edge in cycle $C_5$.

**Definition 2.7** Duplication of a vertex $v$ by a new edge $e = ab$ in a graph $G$ produces a new graph $H$ such that $N(a) = \{v, b\}$ and $N(b) = \{v, a\}$.

**Theorem 2.6** Let $G$ be the graph obtained by duplicating a vertex by an edge in Cycle $C_n$. $G$ admits mean sum square prime labeling, when $n$ is odd and $(n+3) \not\equiv 0 \pmod{26}$.

**Proof**: Let $G$ be the graph and let $v_1, v_2, \ldots, v_{n+2}$ are the vertices of $G$.

Here $|V(G)| = n+2$ and $|E(G)| = n+3$.

Define a function $f : V \to \{0, 1, 2, 3, \ldots, n+1\}$ by

$f(v_i) = i-1, \quad i = 1, 2, \ldots, n+2$

Clearly $f$ is a bijection.

For the vertex labeling $f$, the induced edge labeling $f_{mssp}^*$ is defined as follows.

\[
\begin{align*}
f_{mssp}^*(v_1, v_n) &= \frac{(n-1)^2}{2} \\
f_{mssp}^*(v_3, v_{n+2}) &= \frac{(n+3)^2}{2}
\end{align*}
\]
Clearly $f_{mssp}$ is an injection.

$gcin$ of $(v_1)$

gcin of $(v_{i+1})$

gcin of $(v_{n+2})$

So, $gcin$ of each vertex of degree greater than one is 1.

Hence G, admits mean sum square prime labeling.

**Theorem 2.7** Let G be the graph obtained by attaching pendant edges to each vertex of cycle $C_n$. G admits mean sum square prime labeling, if $n$ is odd.

Proof: Let G be the graph and let $v_1, v_2, \ldots, v_{2n}$ are the vertices of G.

Here $|V(G)| = 2n$ and $|E(G)| = 2n$

Define a function $f : V \rightarrow \{0, 1, 2, 3, \ldots, 2n-1\}$ by

$f(v_i) = i-1$, $i = 1, 2, \ldots, 2n$

Clearly $f$ is a bijection.

For the vertex labeling $f$, the induced edge labeling $f_{mssp}^*$ is defined as follows

$f_{mssp}^*(v_{2i-1} \ v_{2i}) = 8i^2 - 12i + 5$, $i = 1, 2, \ldots, n$

$f_{mssp}^*(v_{2i-1} \ v_{2i+1}) = 8i^2 - 8i + 2$, $i = 1, 2, \ldots, n-1$

$f_{mssp}^*(v_1 \ v_{2n-1}) = 2n^2 - 4n + 2$

Clearly $f_{mssp}^*$ is an injection.

$gcin$ of $(v_{2i-1})$

So, $gcin$ of each vertex of degree greater than one is 1.

Hence G, admits mean sum square prime labeling.
