Abstract:
This study deals the investigation of heat transfer of non-Newtonian fluid in the presence of a porous bounding wall. Perturbation method is applied for the solution of non-linear differential equation. The main focus of this paper is to investigate the effects of parameters such as Reynolds number Re, Prandtl number Pr, permeability parameter K and n in the velocity of fluid and temperature coefficient. For fulfilling the purpose Matlab software has been used. The results show that velocity of non-Newtonian increases with increase of Reynolds number Re and temperature increases with increases of Prandtl number Pr.

Keywords: Non-Newtonian Fluid; Reynolds number; Prandtl number; Porous Media; permeability parameter.

1. Introduction

The non-Newtonian fluid flow through a porous medium produced by temperature differences is one of the most considerable and contemporary subjects and found the great applications, in geothermic, geophysics, chemicals, cosmetics, pharmaceuticals and industrial technology. The practical interest in convective heat transfer in porous medium is expanded rapidly, due to the wide range of applications in engineering fields. Rivlin (1955) has studied plane strain of a net formed by inextensible cords. Christopher and Middleman (1965) have studied power-law flow through a packed tube. Blottner (1970) has studied finite-difference methods of solution of the boundary-layer equations.

Chamkha (1977) has studied similarity solution for thermal boundary layer on a stretched surface of a non-Newtonian fluid. Dharmadhikari and Kale (1985) have studied flow of non-Newtonian fluids through porous media. Chen and Chen (1988) have studied free convection of non-Newtonian fluids along a vertical plate embedded in a porous medium. Wang Chaoyang and Tu Chuanjing (1989) have studied boundary-layer flow and heat transfer of non-Newtonian fluids in
porous media. Hooper et al. (1993) have studied mixed convection from a vertical plate in porous media with surface injection or suction. Choi (1995) has studied enhancing thermal conductivity of fluids with nanoparticles in developments and applications of non-Newtonian flows. Das et al. (1996) have studied radiation effects on flow past an impulsively started infinite isothermal plate. Yih (1998) has studied Coupled heat and mass transfer in mixed convection over a wedge with variable wall temperature and concentration in porous media: The entire regime. Magyari et al. (1999) have studied heat and mass transfer in the boundary layers on an exponentially stretching continuous surface.

In this study perturbation Technique is applied to find the approximate solution of nonlinear differential equation for non-Newtonian fluid flow in axisymmetric channel with a porous wall for turbine cooling applications. The results are given for the velocity of non-Newtonian fluid and temperature for various values of Reynolds number Re, Prandtl number Pr, permeability parameter K and parameter n.

2. Mathematical Formulation

In this paper we study the simultaneous development of fluid flow and heat transfer of non-Newtonian fluid flow is investigated, it is the applicable on the turbine disc for the cooling
purposes. The problem is shown schematically in Fig. 1. In this Figure y-axis is perpendicular to the heated disc surface, which is shown the x-axis. The porous wall is parallel to heated disc axis. The perforated disc of the channel is located at \( y = +L \). The non-Newtonian fluid is injected from the other porous wall uniformly in order to cool the heated wall that coincides with the x-axis.

Here we observed in Figure 1 the cooling problem of the disk can be considered as a inactivity point flow with injection. For a steady, axisymmetric non-Newtonian fluid flow for the following equations in the cylindrical coordinates.

The equation of continuity is

\[
\frac{\partial (r U_r)}{\partial r} + \frac{\partial (r U_z)}{\partial z} = 0, \tag{1}
\]

Momentum equation is

\[
U_r \frac{\partial (U_r)}{\partial r} + U_z \frac{\partial (U_r)}{\partial z} = -\frac{1}{\rho} \frac{\partial P}{\partial r} + \frac{1}{\rho} \left( \frac{\partial \tau_{rr}}{\partial r} + \frac{1}{r} \left( \tau_{rr} - \tau_{\theta \theta} \right) + \frac{\partial \tau_{rz}}{\partial z} \right), \tag{2}
\]

\[
U_r \frac{\partial (U_z)}{\partial r} + U_z \frac{\partial (U_z)}{\partial z} = -\frac{1}{\rho} \frac{\partial P}{\partial z} + \frac{1}{\rho} \left( \frac{\partial \tau_{rz}}{\partial r} + \frac{1}{r} \tau_{rz} + \frac{\partial \tau_{zz}}{\partial z} \right) \tag{3}
\]

Where \( \tau_{rr}, \tau_{rz}, \tau_{zr}, \tau_{zz} \) are the components of the stress matrix. \( U_r, U_z \) are the velocity of fluid in the \( r \) and \( z \) directions; \( \rho, P \) are the density, Pressure of the fluids. The boundary conditions are

\[
U_r = U_z = 0 \quad \text{for} \quad z = 0, \tag{4}
\]

\[
U_r = 0, U_z = -V \quad \text{for} \quad z = L, \tag{5}
\]

Here \( V \) is the injection velocity: For particular class of viscoelastic and viscoinelastic fluids Rivlin [1] showed that if the stress components \( \tau_{ij} \) at a point \( x, k \) (k=1,2,3) and time \( t \) are
considered to be polynomials in the velocity components \((\delta v_m)/(\delta x_n)\) \((m,n=1,2,3)\) and the acceleration components \((\delta a_m)/(\delta x_n)\) \((m,n=1,2,3)\), and if in addition the medium is assumed to be isotropic the stress matrix can be expressed in the form

\[
\|\tau\| = \phi_0 I + \phi_1 A + \phi_2 B + \phi_3 A^2 + \cdots
\]  

(6)

Here \(\phi_k\) \((k=0,1,2,3)\) is polynomials in the invariants of \(A, B, A^2\). This study is restricted to second order fluids for which \(\phi_k\) \((k=0,1,2,3)\) are constant and \(\phi_k\) \((k=4,5,\ldots)\) are zero, and \(I\) is the unit matrices. \(A\) and \(B\) are symmetric kinematic matrixes defined by:

\[
A = \left\| \frac{\delta v_i}{\delta x_j} + \frac{\delta v_j}{\delta x_i} \right\|, \quad B = \left\| \frac{\delta a_i}{\delta x_j} + \frac{\delta a_j}{\delta x_i} + 2\frac{\delta v_m}{\delta x_j} \frac{\delta v_m}{\delta x_i} \right\|
\]  

(7)

The stress components are

\[
\tau_{rr} = \phi_1 A_{rr} + \phi_2 A_{rr}^2 + \phi_3 B_{rr},\tag{8}
\]

\[
\tau_{zz} = \phi_1 A_{zz} + \phi_2 A_{zz}^2 + \phi_3 B_{zz},\tag{9}
\]

\[
\tau_{\theta\theta} = \phi_1 A_{\theta\theta} + \phi_2 A_{\theta\theta}^2 + \phi_3 B_{\theta\theta},\tag{10}
\]

\[
\tau_{rz} = \phi_1 A_{rz} + \phi_2 A_{rz}^2 + \phi_3 B_{rz}.	ag{11}
\]

For the solution of this problem depicted in the figure 1 in the case of axially symmetric flow it is convenient to define a stream function so that the continuity equation is satisfied:

\[
\psi = V_r r^2 f(\lambda),\tag{12}
\]

Where \(\lambda = z/L\) and the velocity components can be derived as:

\[
U_r = V_r / L \ f'(\lambda) \quad \text{and} \quad U_z = -2 V f(\lambda).\tag{13}
\]

Using equation (12) and (13), in equation (2) and (3) and then pressure term eliminated, we get the differential equation

\[
f^{IV} + 2Re f f''' - K_1 Re(4f'' f''' + 2f'' f^{IV}) - K_2 Re(4f'' f''' + 2f' f^{IV} + 2f f^{V}) = 0,\tag{14}
\]

Where \(K_1 = \phi_2 / (\rho L^2)\), \(K_2 = \phi_3 / (\rho L^2)\) is injection Reynolds number, For \(K_2 = 0\), the equation turned as

\[
f^{IV} + 2Re f f''' - KRe(4f'' f''' + 2f' f^{IV}) = 0,\tag{15}
\]

Where \(K_1 = K\). The boundary conditions are:

\[
f(0) = f'(0) = f''(1) = 0 \quad \text{and} \quad f'(1) = 1.	ag{16}
\]

The energy equation for this problem with viscous dissipation in non-Newtonian form is given by
\[ \rho C \left( U_r \frac{\partial T}{\partial r} + U_z \frac{\partial T}{\partial z} \right) = \bar{k} \nabla^2 T + \phi, \quad (17) \]

\[ \phi = \tau_{rr} \frac{\partial u_r}{\partial r} + \tau_{\theta \theta} \frac{u_r}{r} + \tau_{zz} \frac{\partial u_z}{\partial z} + \tau_{rz} \left( \frac{\partial u_r}{\partial z} + \frac{\partial u_z}{\partial r} \right), \quad (18) \]

Where \( U_r, U_z \) are the velocity components in the \( r \) and \( z \) directions and \( V \) is the injection velocity; \( \rho, P, T, C, k^- \) are the density, pressure, temperature, specific heat and heat conduction coefficient of the fluid, respectively, \( \phi \) is the dissipation function. Assuming the blade wall (\( z=0 \)) temperature distribution be

\[ T_w = T_0 + \sum_{n=0}^{\infty} C_n \left( \frac{r}{L} \right)^n \quad (19) \]

And assuming the fluid temperature to have the form of \[1\]

\[ T = T_0 + \sum_{n=0}^{\infty} C_n \left( \frac{r}{L} \right)^n q_n(\lambda) \quad (20) \]

Where \( T_0 \) is the temperature of the incoming coolant (\( z = L \)) and neglecting dissipation effect the following equations and boundary conditions are obtained:

\[ q_n'' = \text{RePr}(n f'' q_n - 2f q'_n) \text{ for } (n = 0, 1, 2, 3, 4) \quad (21) \]

\[ q_n(0) = 1, \quad q_n(1) = 0. \quad (22) \]

The above differential equation (15) and (21) solved by perturbation technique, given below.

### 3. Method of Solution

In this paper we have applied the perturbation technique for the solution of non-linear differential equation with suitable boundary conditions, which is given above. We take the series

\[ f(\lambda) = f_0(\lambda) + \text{Re} f_1(\lambda) + \text{Re}^2 f_2(\lambda) + \cdots = \sum_{m=0}^{\infty} \text{Re}^m f_m(\lambda) \quad (23) \]

\[ q_n(\lambda) = q_{n0}(\lambda) + \text{Re} q_{n1}(\lambda) + \text{Re}^2 q_{n2}(\lambda) + \cdots = \sum_{m=0}^{\infty} \text{Re}^m q_{nm}(\lambda) \quad (24) \]

Putting these values of equation (23) in equation (15), we get

\[ \{ f_0''(\lambda) + \text{Re} f_1''(\lambda) + \text{Re}^2 f_2''(\lambda) + \cdots \} + 2\text{Re} \{ f_0(\lambda) + f_1(\lambda) + \text{Re}^2 f_2(\lambda) + \cdots \} = 0, \quad (25) \]

Taking the coefficient of \text{Re}^0, \text{Re}^1, \text{we get}

\[ f_0''(\lambda) = 0, \quad (26) \]
Putting these values of equation (24) in equation (21), we get

\[ q''_n(\lambda) + Re q''_n(\lambda) + Re^2 q''_n(\lambda) + \cdots \right) - Re Pr[n \{ f'_0(\lambda) + Re f'_1(\lambda) + Re^2 f'_2(\lambda) + \cdots \} q_n(\lambda) + Re q_{n1}(\lambda) + Re^2 q_{n2}(\lambda) + \cdots] - 2[f_0(\lambda) + Re f_1(\lambda) + Re^2 f_2(\lambda) + \cdots] q'_n(\lambda) + Re q'_{n1}(\lambda) + Re^2 q'_{n2}(\lambda) + \cdots]. \tag{28} \]

Taking the coefficient of \( Re^0, Re^1, Re^2 \), we get

\[ q''_n(\lambda) = 0, \tag{29} \]
\[ q''_{n1}(\lambda) = Pr(nq_{n0}f'_0 - 2f_0q'_{n0}). \tag{30} \]
\[ q''_{n2}(\lambda) = Pr[n\{q_{n0}(\lambda) f'_1(\lambda) + q_{n1}(\lambda) f'_0(\lambda)\} - 2f_0(q_{n1}(\lambda) + f_1(\lambda)q_{n0}(\lambda))]. \tag{31} \]

Now solving the above equation (26), (27), (29), (30) and (31) using the boundary condition (16) & (22)

\[ f_0(\lambda) = 3\lambda^2 - 2\lambda^3, \tag{32} \]
\[ f_1(\lambda) = \left(\frac{223}{70} - \frac{6}{5} K\right) \lambda^2 - \left(\frac{79}{35} - \frac{24}{5} K\right) \lambda^3 - 6K\lambda^4 + \frac{12}{5} K\lambda^5 + \frac{1}{10} \lambda^6 - \frac{1}{35} \lambda^7. \tag{33} \]

Taking the coefficient of \( Re^0, Re^1, Re^2 \), we get

\[ q_{n0}(\lambda) = 1 - \lambda, \tag{34} \]
\[ q_{n1}(\lambda) = 1 - \frac{(10 + 3PrRe(n-1))}{10} \lambda + Pr Re \left\{ n \lambda^3 - \frac{(2n-1)}{2} \lambda^4 + \frac{(3n-2)}{10} \lambda^5 \right\}, \tag{35} \]
\[ q_{n2}(\lambda) = 1 - (1 - 0.0257143 Pr^2 Re^2 n^2 + 0.399333 n Pr^2 Re^2 - 0.32246034 Pr^2 Re^2 - 0.333381 n Pr^2 Re - 0.28Kn Pr^2 Re - 0.005714286K Pr^2 Re) \lambda + Pr[n(2.061905 - 0.4 K)\lambda^3 - 0.2K - 5.30952 + 2.09524 n - 1.4K n - 0.15PrRe n(n-1)]\lambda^4 + [0.48K + 0.074286 + 0.09 Pr(n-1) + 0.6386 n - 1.92K n + 0.09 PrRe n(n-1)]\lambda^5 + [0.2 n^2 PrRe + 1.2 K n - 0.2 - 0.06 PrRe (11n - 1) - 0.4K] \lambda^6 + [0.114286 K + 0.285743 PrRe (2n - 1) - 0.271429 n - 0.0714286 PrRe n(4n - 1)]\lambda^7 + [0.0107143 PrRe (13n - 2) - 0.014286 - 0.01786 PrRe (25n - 11) - 0.00357143] \lambda^8 + [0.0194444 PrRe (3n - 2) - 0.003574287]]. \tag{36} \]
Now putting the value of equation (32), (33), (34), (35), (36) in equation (23) and (24), we get the solution of non-linear differential equation (15) & (21)

$$f(\lambda) = 3\lambda^2 - 2\lambda^3 + Re \left[ \left( \frac{223}{70} - \frac{6}{5} K \right) \lambda^2 - \left( \frac{29}{35} - \frac{24}{5} K \right) \lambda^3 - 6K\lambda^4 + \frac{12}{5} K\lambda^5 + \frac{1}{10} \lambda^6 - \frac{1}{35} \lambda^7 \right],$$

Equation (37)

$$q_n(\lambda) = 1 - \lambda + Re \left[ 1 - \frac{10 + 3PrRe(n-1)}{10} \lambda + PrRe \left\{ n \lambda^3 - \frac{(2n-1)}{2} \lambda^4 + \frac{(3n-2)}{10} \lambda^5 \right\} \right] +$$

$$Re^2 \left[ 1 - (1 - 0.0257143 Pr^2 Re^2 n^2 + 0.398333 n Pr^2 Re^2 - 0.32246034 Pr^2 Re^2 - 0.333381 n PrRe - 0.28 KnPrRe - 0.005714286 K PrRe) \lambda + PrRe(n(2.061905 - 0.4 K)\lambda^3 - 0.2K - 5.30952 + 2.09524 n - 1.4K n - 0.15 PrRe n(n-1)) \lambda^4 + \left( 0.48K + 0.074286 + 0.09 Pr(n-1) + 0.6386 n - 1.92K n + 0.09 PrRe n(n-1) \right) \lambda^5 + \left( 0.2 n^2 PrRe + 1.2 K n - 0.2 - 0.06 PrRe(11n - 1) - 0.4K \right) \lambda^6 + \left( 0.114286 K + 0.285743 PrRe(2n - 1) - 0.271429 n - 0.0714286 PrRe n(4n - 1) \right) \lambda^7 + \left( 0.0107143 PrRe(13n - 2) - 0.014286 - 0.01786 PrRe(25n - 11) - 0.00357143 \right) \lambda^8 + \left( 0.0194444 PrRe(3n - 2) - 0.003574287 \right) \right] + \cdots$$

Equation (38)

The Graphs have been plotted with described set of parameters and discussed in detail in the next section.

4. Results and Discussion

The objective of the present study is to find out the solution of heat transfer of non-Newtonian fluid in the presence of a porous bounding wall, for the purpose we have used the perturbation technique. In this paper the graph of non-Newtonian fluid velocity and Temperature coefficient against distance have been plotted using constant Reynolds number, Prandtl number and other parameter. Fig 2 represents the graph between dimensionless variable $\lambda$ and velocity of non-Newtonian fluid $f(\lambda)$: From this figure increase of dimensionless variable $\lambda$ velocity of fluid increases slowly in the range($0 \leq \lambda \leq 1.4$). It is seen that increase of Reynolds number $Re$ velocity of fluid increases sharply. Fig 3 represents the graph between dimensionless variable $\lambda$ and fluid velocity of non-Newtonian fluid $f(\lambda)$: From this increase of dimensionless variable $\lambda$ velocity of fluid increases slowly in the range($0 \leq \lambda \leq 1.5$) and sharply increases in the range($1.5 \leq \lambda \leq 2.5$). It is seen that increase of Reynolds number $Re$ velocity of fluid increases sharply.

Fig 4 is the graph between dimensionless variable $\lambda$ and velocity of non-Newtonian fluid $f(\lambda)$, increase of dimensionless variable $\lambda$ velocity of non-Newtonian fluid $f(\lambda)$ increases in the range($0 \leq \lambda \leq 1$) at constant Reynolds number $Re = 3$; It is seen that increase of permeability parameter $K$ velocity of fluid increases. Fig 5 is the same graph as fig 4 at different Reynolds number $Re =$
9.2 and the effect of permeability parameter $K$ is same as in the Fig 4. Whereas in from Fig 6, it is the reciprocal effect of permeability parameter $K$ for negative Reynolds number $Re = -13.88$. Fig 7 is graph between dimensionless variable $\lambda$ and velocity of fluid $f(\lambda)$, increase of dimensionless variable $\lambda$ velocity of non-Newtonian fluid $f(\lambda)$ increases slowly in the $(0 \leq \lambda \leq 1.5)$ then increases sharply in the range $(1.5 \leq \lambda \leq 2.5)$; it is seen that increase of permeability parameter $K$ velocity of fluid increases sharply.

Fig 8a & 8b is graph between dimensionless variable $\lambda$ and radial velocity of non-Newtonian fluid $f'(\lambda)$ at constant Reynolds number $Re = 2$, increase of dimensionless variable $\lambda$ in the range $(0 \leq \lambda \leq 1)$ radial velocity of fluid increases sharply then decreases sharply. This curve is like as half sine nature; it is seen that increase of permeability parameter $K$ the sharpness of radial velocity of fluid increases. Fig 9a represents the graph between dimensionless variable $\lambda$ and radial velocity of fluid $f''(\lambda)$ at constant parameter $K = 0.5$ in the range $(0 \leq \lambda \leq 1)$, increase of dimensionless variable $\lambda$ radial velocity of fluid $f''(\lambda)$ slowly increases then decreases, it is flat type curve; it is seen that the increase of Reynolds number $Re$ radial velocity of fluid $f''(\lambda)$ increases sharply then decreases sharply, it is peaked type of curve. Fig 9b represents the graph between dimensionless variable $\lambda$ and radial velocity of fluid $f''(\lambda)$ at constant variable $K = 0.5$ in the range $(0 \leq \lambda \leq 2.5)$, increase of dimensionless variable $\lambda$ radial velocity of fluid $f''(\lambda)$ slowly increases then decreases slowly in the range $(0 \leq \lambda \leq 1.5)$, and increases sharply in the range $(1.5 \leq \lambda \leq 2.5)$; it is seen that the increase of Reynolds number $Re$ radial velocity of fluid $f''(\lambda)$ increases sharply then decreases sharply.

Fig 10 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n(\lambda)$ at constant variable $Re = 0.5$, $Pr = 3.0$, $n = 2.0$ in the range $(0 \leq \lambda \leq 1)$, increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n(\lambda)$ decreases slowly then increases sharply: it is seen that the increase of permeability parameter $K$ temperature coefficient of fluid $q_n(\lambda)$ increases. Fig 11 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n(\lambda)$ at constant variable $k = 0.5$, $Pr = 3.0$, $n = 2.0$ in the range $(0 \leq \lambda \leq 1)$, increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n(\lambda)$ decreases slowly then increases sharply: it is seen that the increase of Reynolds number $Re$ temperature coefficient of fluid $q_n(\lambda)$ increases sharply.

Fig 12 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n(\lambda)$ at constant variable $k = 0.5$, $Re = 1.0$, $n = 2.0$ in the range $(0 \leq \lambda \leq 1)$, increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n(\lambda)$ decreases slowly then increases sharply: it is seen that the increase of Prandtl number $Pr$ temperature coefficient of fluid $q_n(\lambda)$ increases more sharply as compared to other results. Fig 13 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n(\lambda)$ at constant variable $k = 0.5$, $Pr = 3.0$, $Re = 1.0$ in the range $(0 \leq \lambda \leq 1)$, increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n(\lambda)$ decreases slowly then increases sharply: it is seen that the increase of Parameter $n$ temperature coefficient of fluid $q_n(\lambda)$ decreases then increases sharply.

Fig 14a represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n(\lambda)$ at constant variable $k = 0.5$, $Pr = 3.0$, $Re = 0.5$ in the range $(0 \leq \lambda \leq 1)$, increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n(\lambda)$ decreases slowly then
increases sharply: it is seen that the increase of Parameter n temperature coefficient of fluid $q_n(\lambda)$ increases sharply. The reciprocal effect has shown in the Fig. 14b. It is seen that increase of parameter n temperature coefficient of fluid $q_n(\lambda)$ decreases sharply at constant parameter $k = 0.5$, $Pr = 3.0$, $Re = 2.0$ in the range($0 \leq \lambda \leq 1$).

Fig 15a represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n'(\lambda)$ at constant variable $k = 0.01$, $Pr = 1.0$, $Re = 2.0$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n'(\lambda)$ increases sharply: it is seen that the increase of parameter $n$ temperature coefficient of fluid $q_n'(\lambda)$ increases. Fig 15b represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n'(\lambda)$ at constant variable $K = 0.01$, $Pr = 3.0$, $Re = 2.0$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n'(\lambda)$ increases sharply: it is been seen that the increase of Parameter $n$ temperature coefficient of fluid $q_n'(\lambda)$ decreases sharply.

Fig 16 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n'(\lambda)$ at constant variable $k = 0.01$, $n = 2.0$, $Re = 2.0$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n'(\lambda)$ increases sharply then decreases sharply: it is seen that the increase of Prandtl number $Pr$ temperature coefficient of fluid $q_n'(\lambda)$ increases sharply then decreases sharply.

Fig 17 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n'(\lambda)$ at constant variable $Pr = 3.0$, $n = 2.0$, $Re = 2.0$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n'(\lambda)$ slowly increases then sharply decreases: it is seen that the increase of variable $k$ temperature coefficient of fluid $q_n'(\lambda)$ increases then decreases sharply.

Fig 18 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n'(\lambda)$ at constant variable $Pr = 3.0$, $n = 2.0$, $k = 0.5$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n'(\lambda)$ slowly increases: it is seen that the increase of Reynolds number $Re$ temperature coefficient of fluid $q_n'(\lambda)$ increases sharply. Fig 19 represents the graph between dimensionless variable $\lambda$ and axial & radial velocity of fluid $f(\lambda)$ & $f'(\lambda)$ at constant variable $k = 0.01$, $Re = 2.0$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the axial velocity of fluid $f(\lambda)$slowly increases and radial velocity of fluid $f'(\lambda)$ increases sharply. Fig 20 represents the graph between dimensionless variable $\lambda$ and temperature coefficient of fluid $q_n(\lambda)$ & $q_n'(\lambda)$ at constant variable $Pr = 3.0$, $n = 2.0$, $k = 0.01$ in the range ($0 \leq \lambda \leq 1$), increase of dimensionless variable $\lambda$ the temperature coefficient of fluid $q_n(\lambda)$ slowly increases: and temperature coefficient of $q_n'(\lambda)$ increases sharply then decreases sharply.

5. Conclusions

In this paper the main objective is to investigate the effect of Reynolds number Re, Prandtl number Pr, permeability parameter k and parameter n. The results show that the increment in the Reynolds number has the similar effects on velocity components and heat component. It increases sharply. At higher Reynolds number the maximum velocity of fluid is shift to the solid wall where shear stress becomes larger as the Reynolds number grows. The increase of permeability parameter k velocity of fluid increases whereas the heat coefficient of fluid is also increased. Increase of Prandtl number Pr heat flow of fluid increases sharply. Increase of parameter n heat flow of fluid decreases sharply. It is investigated that Reynolds numbers sharply affect the velocity of fluid and heat flow of fluid. This study have practical applications in nuclear engineering control, plasma aerodynamics, mechanical engineering manufacturing processes, astrophysical fluid dynamics, filtration technology, geothermal energy and precipitation.
