ABSTRACT

Oxazine compounds have drew the attention of many researchers to find different approaches to the synthesis of this type of compounds according to the success of their use in a wide range of pharmaceutical application during the last decades. It is also for the difference reactivity of these analogues is exhaustively depicted and illustrates the rich versatility of this class of starting material. They proved to have most of actions of a combination of other drugs. We are herein investigate the synthesis of ethyl aryloxy acetate(S1-6) from the reaction of the corresponding ethyl bromo acetate with aryl phenols. These intermediates were cyclized with antharanilic acid affording the titled compounds.

1. INTRODUCTION

The chemistry of Oxazine becomes an important branch of heterocyclic compounds not just as synthetic intermediates but also due to the wide spectrum application of this type of compounds in medicine. There are many routes for their preparation were employed some of them from malonyl chloride [1], [2], Ethyl salicylate [3] Other methods of synthesis such as the work of N.R Taati et-al from the condensation of 3-amino propanol with carboxylic acids under solvent free condition [4]. Nadeem Siddiquia and his co-workers have reviewed the synthesis of some 1,3-oxazines from the condensation of different types of phenols such as hydroquinone, sulfone scaffold, Chavicol, Eugino l, Cardanol as well as salicylic acid with different amines in presence of formaldehyde and studied the biological activity of the synthesized compounds [5]. Ahmed El-Mekabaty in2013 have reviewed versatile methods for oxazine synthesis from antharanilic acid and its derivatives [6]. Sayaji and Pravina B. Piste have reported the preparation of some 1,3-oxazine compounds from phenols and aromatic aldehydes in methanolic ammonia and have studied their anti-microbial activity against two gram positive and two gram negative bacteria. Antifungal activity was screened against Candidaalbicans, Aspergillus niger [7]. Some other researchers have cyclized chalcones into 1,3-oxazines using fly-ash and other catalysts. They also studied their antimicrobial activities. Against gram negative bacteria [8], [9]. Chaitra G. and Rohini RM have also synthesized 1,3-oxazine compounds from pyridyl
New Approach for The Synthesis of Aryloxy 1,3-Oxazines

Chalcones and studied their Anti-Oxidant and Anti-Inflammatory activity [10]. Among the other medical application of the oxazine compounds is the work of Vashundhra Sharma and his coworkers in synthesis and anti cancer study of 2-oxo-benzo [1], [4] oxazines [11]. J.C. Wouter. de Bruijna and his coworkers have studied the drug designing of 1,4-oxazines and found that their possible multitarget mechanism of the studied compounds as anti-inflammatory drug through quantitative structure-activity relationships (QSAR) [12]. Dadmohammad and his coworker have reported a green and efficient method for the synthesis of 1,3 oxazine compounds from aroyl chlorides and hydroxyl naphthaquinone in presence of ammonium thiocyanate at ambient temperature [13]. In 1919-2020 researchers studied the synthesis of 1,3-oxazines and their human DNA topoisomerase I inhibitory potentials [14]. Recently Seyed Gholamhossein Mansouri et-al have synthesized naphtho [1,2-e] [1], [4]oxazines and studied their anticancer and antifungal activity [15]. According to the above utility and applications of this type of heterocyclic compounds and in continuing of our current drug discovery program [16], [17], [18] we have synthesize new 1,3-oxazine derivatives using new route of condensation protocol.

2. EXPERIMENTAL

All melting points were uncorrected using thermal SMP30 UK melting point apparatus. IR spectra were recorded using Alpha (ATR) instrument. 1HNMR spectra were recorded using Varian Agilent 499.53MHZ instrument, DMSO as internal solvent. All chemical were supplied by sigma –Aldrich, BHD and Fluka companies.

3. Synthesis of ethyl substituted aryloxy acetate(S1-6)

Using an elsewhere similar procedure of preparation of 1, 3, 4-oxadiazole Derivatives [19], A mixture of any indicated phenols (1mmol), ethyl bromoacetate (0.122g, 1mmol) and anhydrous potassium carbonate (0.55g,4mmol)in 30 ml of dry acetone was refluxed for 20 h. the reaction mixture was evaporated under reduced pressure, The residue was dissolved in water. The final solution was extracted with ether, The ether extract was then dried over sodium sulphate anhydrous and filtered off. Evaporation of the solvent afforded the crude product which was crystallized from ethanol. Table (1) below shows the physical properties of the titled compounds.

4. SYNTHESIS OF 2-ARYLOXY METHYL -3,1-BENZOXAZINE-4-ONE : (S7-12)

Similar published procedure was used for the synthesis of the above compounds [20]. So, a quimolar amounts of anthranilic acid (0.13g,1mmol) and (S1-6), (1mmol) were heated at (110 0C) on sand bath for 5 hs. The reaction mixture was then treated by addition of 20 ml. ethanol, The crude precipitated product was filtered off and was then crystallized from petroleum ether(60-80) Table(2) below shows the physical properties of the synthesized compounds.

5. RESULTS AND DISCUSSION

5.1. ETHYL SUBSTITUTED ARYLOXY ACETATE (S1-6)

These compounds (Scheme 1) were synthesized using similar reported procedure\textsuperscript{102}, and were characterized by the following main absorption bands ($\nu_{\text{max}}$ cm$^{-1}$) at (3003-3198) for C-H aromatic, (2835-2971) for C-H aliphatic, (1628-1687) for C=O, (1048-1166) for C-O-C. The other absorption bands were shown in Table (3).
